Hi Zach and Theo,

Regarding the email and SMS notification management module in SBE, we would like to share the following insights. We plan to proceed with development based on your feedback:

1. Trigger Event should be system-controlled and read-only: The "Trigger Event" defines which business action (e.g., order confirmation, lead assignment) triggers a specific template. To avoid the risk of mapping templates to the wrong business events, this field should not be editable by admins.
2. "FROM" Email should not be freely editable: Allowing admins to manually edit the sender address can cause issues with SPF, DKIM, and DMARC validation, negatively impacting deliverability and domain reputation.
3. "TO" Recipient logic should be backend-controlled: Recipient logic should be handled automatically by the backend based on business workflows rather than manual configuration. For example:
 - Order confirmation → Customer
 - Lead assignment → Assigned Service Provider
 - Admin alert → Internal operations team
4. CC/BCC fields can support controlled flexibility: These fields can remain configurable but should be limited to selecting predefined internal users or manual entries that pass strict validation.
5. Template Constants/Placeholders should use a controlled picker: Placeholders (e.g., {{customer_name}}, {{invoice_number}}) should be selected from a predefined list rather than entered as free text. This prevents manual errors that result in broken dynamic content or unsupported placeholders.

Please let us know your thoughts so we can align the development accordingly.

Best regards,

Amrin Mujawar

1. Trigger Event should be system-controlled and read-only: The "Trigger Event" defines which business action (e.g., order confirmation, lead assignment) triggers a specific template. To avoid the risk of mapping templates to the wrong business events, this field should not be editable by admins.

But what if we want to create new alerts on our own? We should be able to edit this field for new events.

2. "FROM" Email should not be freely editable: Allowing admins to manually edit the sender address can cause issues with SPF, DKIM, and DMARC validation, negatively impacting deliverability and domain reputation.

Again, if we want to create new notifications on our own how would we do this if the from is not manually editable? If not manually? Can we choose from all the users in the system? If not, you have the list of the most common ones. If we had a drop down of the most commonly used FROM emails like clientservices@theshowproducers.com, salesperson@theshowproducers.com, productionteam@theshowproducers.com, conference@theshowproducers.com and a list of all active users emails in the system would that still impact deliverability? I just want to make sure we can still create our own.

3. "TO" Recipient logic should be backend-controlled: Recipient logic should be handled automatically by the backend based on business workflows rather than manual configuration. For example:

- Order confirmation → Customer
- Lead assignment → Assigned Service Provider
- Admin alert → Internal operations team

Again I would like a drop down here with all the common TO recipients like {client_email_address}, {salesperson_email_address}, s@theshowproducers.com, all@theshowproducers.com. I'm not sure how this would work for the vendor emails where it pulls dynamically from the email address in show details but we need to be able to create these on our own so that should be available in the drop down. Without being able to enter an email address manually how would we create the product specific alerts? I just don't see how we would be able to create any new alerts ourselves without editability

4. CC/BCC fields can support controlled flexibility: These fields can remain configurable but should be limited to selecting predefined internal users or manual entries that pass strict validation.

We should still have access in a dropdown to common fields from the rest of the system like {salesperson} as well as the ability to enter a custom email if we want to alert people outside our organization. If the TO Field is problematic we can add as CC or BCC I suppose as a workaround but not ideal.

5. Template Constants/Placeholders should use a controlled picker: Placeholders (e.g., {{customer_name}}, {{invoice_number}}) should be selected from a predefined list rather than entered as free text. This prevents manual errors that result in broken dynamic content or unsupported placeholders.

Yes, there are 100's of form fields we want to pull from. For example, vendor emails can pull from show details, order emails can pull the order info, product emails like workshop and keynote can pull the scheduled time from the dashboard and the name of the presentation, etc.

Hi Theo,

Regarding the email and SMS notification management, the logic for predefined emails will remain as previously discussed. To address your need for creating new alerts, we will introduce a "Custom Email" option with the following features:

1. Trigger Event: You will be able to select the event from a predefined list.
2. "FROM" Email: This will be selectable; however, the domain will remain fixed and predefined to ensure deliverability and domain reputation.
3. "TO" Recipient: You can select from a predefined list, including admin users, exhibitors, and other relevant system emails.
4. CC/BCC Fields: These will mirror the "TO" field logic, allowing you to select from a predefined list or enter a custom email address subject to strict validation.
5. Template Constants/Placeholders: A controlled picker will be provided to select placeholders from a predefined list based on the chosen trigger event.

Please let us know if this approach aligns with your requirements so that we can plan accordingly.

Best regards,

Amrin Mujawar

That should work. As long as we can make modifications to the existing email body/subject line of the predefined emails and can disable-re-enable them if needed.

I have a few suggestions too:

1. Trigger Event: You will be able to select the event from a predefined list.

Put in time delays if possible. Either send immediately or wait X mins/hours/days

2. "FROM" Email: This will be selectable; however, the domain will remain fixed and predefined to ensure deliverability and domain reputation.

Make sure you have TheShowProducers.com and TheSmallBusinessExpo.com as the sending domains in there as options.

And there is an easy way to add additional email addresses for the FROM email at these domains.

We should also be able to update the actual name that is associated with the FROM email.

3. "TO" Recipient: You can select from a predefined list, including admin users, exhibitors, and other relevant system emails.

Allow us to also add emails manually that are not inside our org.

4. CC/BCC Fields: These will mirror the "TO" field logic, allowing you to select from a predefined list or enter a custom email address subject to strict validation.

Allow us to also add emails manually that are not inside our org.

5. Template Constants/Placeholders: A controlled picker will be provided to select placeholders from a predefined list based on the chosen trigger event.

Per Theo, allow us to make edits to templates as needed. Or create new ones.

Hello Zach and Theo,

Based on your suggestions, I have outlined our updated approach below:

1. Trigger Event: You will be able to select the event from a predefined list.

Put in time delays if possible. Either send immediately or wait X mins/hours/days - Adding custom trigger selection and time-delay workflows (send immediately / after X minutes / hours / days) significantly increases implementation complexity, queue management, and retry handling.

Considering the current project timeline and delivery scope, we recommend proceeding with predefined system-controlled events and immediate email execution for the current phase.

2. "FROM" Email: This will be selectable; however, the domain will remain fixed and predefined to ensure deliverability and domain reputation.

Make sure you have TheShowProducers.com and TheSmallBusinessExpo.com as the sending domains in there as options.

And there is an easy way to add additional email addresses for the FROM email at these domains.

We should also be able to update the actual name that is associated with the FROM email. - Agreed, these feature will be available to custom emails

3. "TO" Recipient: You can select from a predefined list, including admin users, exhibitors, and other relevant system emails.

Allow us to also add emails manually that are not inside our org. - Yes, manual entry will be available in custom emails

4. CC/BCC Fields: These will mirror the "TO" field logic, allowing you to select from a predefined list or enter a custom email address subject to strict validation.

Allow us to also add emails manually that are not inside our org. - Yes, manual entry will be available in custom emails

5. Template Constants/Placeholders: A controlled picker will be provided to select placeholders from a predefined list based on the chosen trigger event.

Per Theo, allow us to make edits to templates as needed. Or create new ones. - Yes with regard to templates, for predefined emails, editing body and subject line will be supported, for custom emails creating and editing both will be supported. With regard to placeholders only a predefined list of placeholders will be supported, placeholders cannot be added, updated or deleted from the predefined list through the admin panel, the predefined placeholder list can change only through code changes.

Please let us know if this aligns with your requirements.

Best regards,
Amrin Mujawar

Cc: Zachary Lezberg <zach@theshowproducers.com>, Abhijit Roy <abhijit.roy@unifiedinfotech.net>, Sayantan Roy <roy@unifiedinfotech.net>, Andreia Susano <andreia@unifiedinfotech.net>, Sabyasachi Chaudhuri <sabyasachi@unifiedinfotech.net>, Sasanka Banerjee <sasanka@unifiedinfotech.net>, Sushobhan Manna <sushobhan@unifiedinfotech.net>, Prantik Saha <prantik@unifiedinfotech.net>, Suman Paul <suman.p@unifiedinfotech.net>

Regarding this point below: This is something that needs to be built, for example the workshop confirmation triggers 24 hours before the workshop time, the workshop keynote reminder triggers 7 days before the time of the event, electric order reminders trigger 35 and 7 days before the event, etc. So many of our trigger events are time delay based, so if this is not built now how would you handle these triggers that were documented in our initial requirements?

Put in time delays if possible. Either send immediately or wait X mins/hours/days - Adding custom trigger selection and time-delay workflows (send immediately / after X minutes / hours / days) significantly increases implementation complexity, queue management, and retry handling.

Considering the current project timeline and delivery scope, we recommend proceeding with predefined system-controlled events and immediate email execution for the current phase.
